

FACT SHEET: Influenza (Flu)

July 2023

WHAT IS INFLUENZA?

Influenza ("the flu"), is a viral respiratory condition caused by influenza viruses that infect the respiratory tract (nose, throat, lungs). "Flu season" occurs in the fall and winter.

WHO CAN GET INFLUENZA?

Anyone can get Influenza. However, people 65 years of age and older, children 5 years and younger, pregnant women, and people with certain chronic health conditions are at a greater risk for serious complications resulting in hospitalization or death.

WHAT ARE THE SYMPTOMS OF INFLUENZA?

People who have the flu often feel some or all of the following symptoms: fever or feeling feverish, chills, cough, sore throat, runny or stuffy nose, muscle or body aches, headaches, and tiredness. Some people, particularly children, may also have vomiting and diarrhea. Symptoms may be mild to severe and may even result in death.

HOW DOES INFLUENZA SPREAD?

The flu virus mainly spreads when an infected person talks, coughs, or sneezes, and droplets dispersed in the air land in the mouth or are breathed in by people nearby. It also spreads by touching your eyes, mouth, or nose after touching surfaces or objects contaminated with the flu virus.

HOW SOON DO SYMPTOMS APPEAR?

Symptoms generally come on suddenly, usually ranging between 1-4 days from infection (on average 2 days).

IS A PERSON WITH INFLUENZA CONTAGIOUS?

Yes. A person infected with the flu may be able to infect others from a day before getting sick to about 5-7 days after getting sick.

HOW IS INFLUENZA TREATED?

While the flu vaccine is the first and most important step in preventing flu, once infected, Influenza antiviral drugs are a treatment option. They work best when started as early as 1-2 days after symptoms begin. They can lessen the severity and

duration of illness by 1-2 days and can help prevent flu complications like pneumonia. Antiviral drugs, however, are not a substitute for vaccination.

SHOULD A PERSON WITH INFLUENZA BE EXCLUDED FROM WORK OR SCHOOL?

Yes. Try to stay home for at least 24 hours after your fever is gone except to get medical care.

CAN INFLUENZA BE PREVENTED?

Yes flu can be prevented by receiving the seasonal flu vaccine every year. Annual flu vaccinations are recommended for all persons 6 months of age and older, with rare exceptions. The vaccine protects against 3–4 types of flu viruses that are expected to be common during the upcoming flu season. Vaccinations are particularly important for persons who are at a greater risk for severe illness, and for those who live with or care for persons at a greater risk for severe illness. It is best to get vaccinated early in the fall soon after the vaccine becomes available (ideally by October). It takes about 2 weeks after vaccination for the body to become protected against the flu virus.

Some other recommendations to decrease the spread of flu:

- Wash your hands frequently with soap and water, scrubbing your hands for at least 20 seconds.
- Cover your mouth and nose with a tissue when you cough or sneeze.
- Avoid touching your eyes, nose and mouth with unwashed hands.
- Clean and disinfect frequently touched surfaces and objects, such as toys, doorknobs, tables, and counters.

WANT MORE INFORMATION?
